CHAPTER 1

strongdoc package

1.1 Subpackages

1.1.1 strongdoc.api package

account module

```
class strongdoc.api.account.AccountInfo(proto_account_info)
Bases: object

    orgid
        str

    org_email
        str

    subscription
        Subscription

    payments
        list(Payment)

    org_address
        str

    multilevel_sharing
        bool

    sharable_orgs
        list(str)

class strongdoc.api.account.Payment(proto_payment)
Bases: object

    billed_at
        datetime.datetime
```

```
period_start
    datetime.datetime

period_end
    datetime.datetime

amount
    float

status
    str

class strongdoc.api.account.Subscription(proto_subscription)
Bases: object

    type
        str

    status
        str

class strongdoc.api.account.UserInfo(proto_user)
Bases: object

    userid
        str

    name
        str

    email
        optional str, otherwise None

    orgid
        optional str, otherwise None

    is_admin
        bool

strongdoc.api.account.add_sharable_org(token, orgid)
```

Adds another org as a sharable org. This requires an administrator privilege.

Parameters

- **token** (*str*) – The user JWT token.
- **orgid** (*str*) – The orgid of the org to add as a sharable org.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns Whether the addition was a success.

Return type `bool`

```
strongdoc.api.account.change_user_password(token, old_password, new_password)
```

Change user password.

Parameters

- **token** (*str*) – The user JWT token.
- **old_password** (*str*) – The user's current password.
- **new_password** (*str*) – The user's new password.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns Whether the change was a success.

Return type `bool`

`strongdoc.api.account.demote_user(token, userid)`

Removes admin privileges from a user. This requires an administrator privilege. A gRPC connection timeout will be implemented.

Parameters

- **token** (`str`) – The user JWT token.
- **userid** (`str`) – The userid of the user to demote.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns Whether the demotion was a success.

Return type `bool`

`strongdoc.api.account.get_account_info(token)`

Gets account information such as subscription details, payments, sharable orgs, etc. This requires an administrator privilege.

Parameters **token** (`str`) – The user JWT token.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns The account information

Return type `AccountInfo`

`strongdoc.api.account.get_user_info(token)`

Gets information about the active user.

Parameters **token** (`str`) – The user JWT token.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns The user information

Return type `UserInfo`

`strongdoc.api.account.list_users(token)`

Lists the users of the active organization.

Parameters **token** (`str`) – The user JWT token.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns A list of all the users in the organization.

Return type `list(UserInfo)`

`strongdoc.api.account.promote_user(token, userid)`

Promotes a user to admin status. This requires an administrator privilege. A gRPC connection timeout will be implemented.

Parameters

- **token** (*str*) – The user JWT token.
- **userid** (*str*) – The userid of the user to promote.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns Whether the promotion was a success.

Return type `bool`

`strongdoc.api.account.register_user(token, name, password, email, make_admin)`

Registers a user for the active organization. This requires an administrator privilege. A gRPC connection timeout will be implemented.

Parameters

- **token** (*str*) – The user JWT token.
- **name** (*str*) – The new user's name.
- **password** (*str*) – The new user's password.
- **email** (*str*) – The new user's email address.
- **make_admin** (*bool*) – Whether or not the new user will be an admin.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns The userID of the new user.

Return type `str`

`strongdoc.api.account.remove_organization(token, force)`

Removes an organization, deleting all data stored with the organization. This requires an administrator privilege. A gRPC connection timeout will be implemented.

Parameters

- **token** (*str*) – The user JWT token.
- **force** (*bool*) – If this is false, removal will fail if there are still data stored with the organization. This prevents accidental deletion.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns Whether the removal was a success.

Return type `bool`

`strongdoc.api.account.remove_sharable_org(token, orgid)`

Removes a sharable org. This requires an administrator privilege.

Parameters

- **token** (*str*) – The user JWT token.
- **orgid** (*str*) – The orgid of the org to remove as a sharable org.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns Whether the removal was a success.

Return type `bool`

`strongdoc.api.account.remove_user(token, userid)`

Removes a user from the active organization. Deletes the user if this is the user's only organization. This requires an administrator privilege. A gRPC connection timeout will be implemented.

Parameters

- **token** (`str`) – The user JWT token.
- **userid** (`str`) – The userid of the user to remove.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns The number of users removed.

Return type `int`

`strongdoc.api.account.set_account_info(token, org_email, org_address)`

Set organization account info. This requires an administrator privilege.

Parameters

- **token** (`str`) – The user JWT token.
- **email** (`str`) – The organization email address. Must be a valid email address.
- **address** (`str`) – The organization address.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns Whether the change was a success.

Return type `bool`

`strongdoc.api.account.set_multilevel_sharing(token, enable)`

Enables or disables multi-level sharing. This requires an administrator privilege.

Parameters

- **token** (`str`) – The user JWT token.
- **enable** (`bool`) – Whether or not multi-level sharing should be enabled.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns Whether the change was a success.

Return type `bool`

`strongdoc.api.account.set_user_info(token, name, email)`

Set user info.

Parameters

- **token** (`str`) – The user JWT token.
- **name** (`str`) – The user's name. Cannot be an empty string.
- **email** (`str`) – The user's email address. Must be a valid email address.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns Whether the change was a success.

Return type `bool`

document module

```
class strongdoc.api.document.DocumentMetadata(_doc)
```

Bases: `object`

docid

`str`

doc_name

`str`

size

`int`

```
strongdoc.api.document.decrypt_document(token, docid, ciphertext)
```

Decrypt a document using the service. The user must provide the ciphertext returned during the encryptDocument API call.

Parameters

- **token** (`str`) – The user JWT token.
- **docid** (`str`) – The ID of the document.
- **ciphertext** (`bytes` or `io.BufferedIOBase` (must be readable)) – The document ciphertext to be decrypted.

Returns The decrypted plaintext content of the document.

Return type `bytes`

Raises

- **TypeError** – If `ciphertext` is not of type `bytes` or type `io.BufferedIOBase` and readable.
- **grpc.RpcError** – Raised by the gRPC library to indicate non-OK-status RPC termination.

```
strongdoc.api.document.decrypt_document_stream(token, docid, ciphertext, output_stream)
```

Decrypt a document using the service. The user must provide the ciphertext returned during the encryptDocument API call.

Parameters

- **token** (`str`) – The user JWT token.
- **docid** (`str`) – The ID of the document.
- **ciphertext** (`bytes` or `io.BufferedIOBase` (must be readable)) – The document ciphertext to be decrypted.
- **output_stream** (`io.BufferedIOBase` (must be writable)) – The output stream the plaintext will be written to.

Return type `None`

Raises

- **TypeError** – If `ciphertext` is not of type `bytes` or type `io.BufferedIOBase` and readable, or `output_stream` is not type `io.BufferedIOBase` and writable.
- **grpc.RpcError** – Raised by the gRPC library to indicate non-OK-status RPC termination.

`strongdoc.api.document.download_document(token, docid)`

Download a document from the service.

Parameters

- `token (str)` – The user JWT token.
- `docid (str)` – The ID of the document.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns The downloaded document.

Return type bytes

`strongdoc.api.document.download_document_stream(token, docid, output_stream)`

Download a document from the service.

Parameters

- `token (str)` – The user JWT token.
- `docid (str)` – The ID of the document.
- `output_stream (io.BufferedIOBase (must be writable))` – The output stream the document will be written to.

Return type None

Raises

- `TypeError` – If `output_stream` is not type `io.BufferedIOBase` and writable.
- `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

`strongdoc.api.document.encrypt_document(token, doc_name, plaintext)`

Encrypts a document using the service, but do not store it. Instead return the encrypted ciphertext.

Parameters

- `token (str)` – The user JWT token.
- `doc_name (str)` – The name of the document.
- `plaintext (bytes or io.BufferedIOBase (must be readable))` – The text of the document.

Raises

- `TypeError` – If `plaintext` is not of type `bytes` or type `io.BufferedIOBase` and readable.
- `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns

- `docID (str)` – The document ID for the uploaded document. This ID is needed to decrypt the document.
- `ciphertext (bytes)` – The encrypted ciphertext of the document.

`strongdoc.api.document.encrypt_document_stream(token, doc_name, plaintext, output_stream)`

Encrypts a document using the service, but do not store it. Instead return the encrypted ciphertext.

Parameters

- **token** (*str*) – The user JWT token.
- **doc_name** (*str*) – The name of the document.
- **plaintext** (*bytes or io.BufferedIOBase (must be readable)*) – The text of the document.
- **output_stream** (*io.BufferedIOBase (must be writable)*) – The output stream the ciphertext will be written to.

Raises

- **TypeError** – If *plaintext* is not of type *bytes* or type *io.BufferedIOBase* and readable, or *output_stream* is not type *io.BufferedIOBase* and writable.
- **grpc.RpcError** – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns The document ID for the uploaded document. This ID is needed to decrypt the document.

Return type *str*

`strongdoc.api.document.list_documents(token)`

Lists the documents that are accessible to the active user.

Parameters **token** (*str*) – The user JWT token.

Raises **grpc.RpcError** – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns A list of documents

Return type *list(DocumentMetadata)*

`strongdoc.api.document.remove_document(token, docid)`

Remove a document from the service.

Parameters

- **token** (*str*) – The user JWT token.
- **docid** (*str*) – The ID of the document.

Raises **grpc.RpcError** – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns Whether the removal was a success.

Return type *bool*

`strongdoc.api.document.share_document(token, docid, userid)`

Shares a document with another user.

Parameters

- **token** (*str*) – The user JWT token.
- **docid** (*str*) – The DocID of the document.
- **userid** (*str*) – The UserID of the user to be shared with.

Raises **grpc.RpcError** – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns Whether the share was a success.

Return type bool

`strongdoc.api.document.unshare_document(token, docid, userid)`

Unshares a document from another user.

Parameters

- **token** (`str`) – The user JWT token.
- **docid** (`str`) – The DocID of the document.
- **userid** (`str`) – The UserID of the user to be unshared from.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns The number of users unshared with.

Return type int

`strongdoc.api.document.upload_document(token, doc_name, plaintext)`

Uploads a document to the service for storage.

Parameters

- **token** (`str`) – The user JWT token.
- **doc_name** (`str`) – The name of the document.
- **plaintext** (`bytes` or `io.BufferedIOBase` (must be readable)) – The text of the document.

Returns The uploaded document ID.

Return type str

Raises

- `TypeError` – If `plaintext` is not of type `bytes` or type `io.BufferedIOBase` and readable.
- `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

login module

`strongdoc.api.login.login(userid, password, orgid)`

Verify the user and organization identity, and returns a JWT token for future API use. There must be a one second difference between logout and login. A gRPC connection timeout will be implemented.

Parameters

- **userid** (`str`) – The login user ID
- **password** (`str`) – The login user password
- **orgid** (`str`) – The login organization ID

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns The JWT token used to authenticate user/org when using StrongDoc APIs.

Return type str

```
strongdoc.api.login.logout(token)
Logs out the user associated with the specified token.
```

Parameters `token` (`str`) – The user JWT token.

Returns The logout status of the user.

Return type `str`

search module

```
class strongdoc.api.search.DocumentResult(docid, score)
Bases: object
```

A class that will hold a single document that matches the search result from the Search query.

docid

`str` - The matching document ID.

score

`float` - The score of the matching document.

```
strongdoc.api.search.search(token, query)
```

Search for document that contains a specific word. A gRPC connection timeout will be implemented.

Parameters

- `token` (`str`) – The user JWT token.
- `query` (`str`) – The query string.

Raises `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.

Returns The hit list of the search.

Return type `list(DocumentResult)`

billing module

```
strongdoc.api.billing.FREQ_MONTHLY = 'MONTHLY'
```

```
strongdoc.api.billing.FREQ_YEARLY = 'YEARLY'
```

```
class strongdoc.api.billing.BillingFrequency(_freq)
Bases: object
```

frequency

`str` (such as `FREQ_MONTHLY` or `FREQ_YEARLY`)

valid_from

`datetime.datetime`

valid_to

`datetime.datetime`

```
class strongdoc.api.billing.DocumentCosts(_costs)
Bases: object
```

cost

`float`

```
size
    float

tier
    str

class strongdoc.api.billing.SearchCosts (_costs)
Bases: object

cost
    float

size
    float

tier
    str

class strongdoc.api.billing.TrafficCosts (_costs)
Bases: object

cost
    float

incoming
    float - Traffic sent to us, in MB

outgoing
    float - Traffic sent to you, in MB

tier
    str

class strongdoc.api.billing.BillingDetails (_details)
Bases: object

period_start
    datetime.datetime

period_end
    datetime.datetime

total_cost
    float

documents
    DocumentCosts

search
    SearchCosts

traffic
    TrafficCosts

billing_frequency
    BillingFrequency

class strongdoc.api.billing.LargeTrafficDetails (proto_large_traffic)
Bases: object

large_traffic_list
    list(TrafficDetails)
```

```
period_start
    datetime.datetime - Start of the billing period

period_end
    datetime.datetime - End of the billing period

class strongdoc.api.billing.TrafficDetails (proto_traffic)
Bases: object

time
    datetime.datetime

userid
    str

method
    str - “STREAM” or “UNARY”

uri
    str - The operation this traffic corresponds to

incoming
    float - Traffic sent to us, in MB

outgoing
    float - Traffic sent to you, in MB

strongdoc.api.billing.get_billing_details(token, at_time=None)
Gets the billing details at a specified time, or the current time if no time is specified. This requires an administrator privilege.
```

Parameters

- `token (str)` – The user JWT token.
- `at_time (datetime.datetime)` – Optional UTC timestamp to check for billing details at. Defaults to current time.

Raises

- `grpc.RpcError` – Raised by the gRPC library to indicate non-OK-status RPC termination.
- `ValueError` – If `at_time` is not a valid datetime.

Returns The requested billing details, or `None` if none are found for the specified time.

Return type `BillingDetails` or `None`

```
strongdoc.api.billing.get_large_traffic(token, at_time=None)
Gets a list of large traffic events (at least 512 MB in one direction) within a specified billing period. This requires an administrator privilege.
```

Parameters

- `token (str)` – The user JWT token.
- `at_time (datetime.datetime)` – Optional UTC timestamp which falls within the desired billing period. Defaults to current time.

Returns The requested large traffic details, or `None` if none are found for the specified time.

Return type `LargeTrafficDetails` or `None`

Raises

- **ValueError** – If *at_time* is not a valid datetime.
- **grpc.RpcError** – Raised by the gRPC library to indicate non-OK-status RPC termination.

1.2 strongdoc.client module

`strongdoc.client.connect_to_server_with_auth(token)`
Creates a secure channel with an authentication token to the StrongDoc Server

Parameters `token` (*str*) – The user JWT token

Returns `channel` – A secure gRPC SSL channel.

`strongdoc.client.connect_to_server_with_no_auth()`
Creates a secure channel to the StrongDoc Server

Returns `channel` – A secure gRPC SSL channel.
